## MONTHLY SUMMARY FOR NOVEMBER 2001

### **November 2001**

*Statewide average temperature = 54.2° F  
Statewide average rainfall = 1.80 inches*

In marked contrast to last year, November 2001 was the 7<sup>th</sup> warmest November over the 110-year period of record in Oklahoma. The statewide-averaged temperature for the month, 54.2 degrees, is 4.4 degrees greater than normal. The warm month left the autumn (September-through-November) statewide-averaged seasonal temperature 0.4 degrees greater-than-normal at 62.0 degrees. The season, which included two relatively cool months, ranks as the 48<sup>th</sup> warmest autumn since record keeping began in 1892. Through its first 11 months, 2001 has a statewide-averaged temperature of 62.7 degrees, 0.5 degree less than normal and 40<sup>th</sup> greatest on record.

Precipitation was, for the most part, somewhat lacking during the month. Some relief was offered, however, from locally heavy rains in north central, northeastern, and southwestern Oklahoma, along with a post-Thanksgiving snowstorm in southwestern and central parts of the state. Northwestern and northern Oklahoma remained very dry, as has been the trend for several months. The statewide-averaged precipitation for the month totaled 1.80 inches, 0.62 inch less than normal, ranking the month near the middle (54<sup>th</sup> least of 110) of November's historical statewide totals. A few very wet months, particularly during the 1961-1990 period from which the normals are computed, have skewed the "normal" toward the wet end. Seasonal and monthly figures display this trend as well. Autumn total precipitation was 7.66 inches, 1.77 inches less than normal, but the season was only the 49<sup>th</sup> driest autumn on record. Total statewide-averaged precipitation through the first 11 months of the year was 29.91 inches, 2.67 inches less than normal and the 43<sup>rd</sup> least January-through-November precipitation on record. Should December precipitation not make up the deficit accrued through the first eleven months of the year, 2001 will be the first year with statewide annual precipitation less than the currently established normal since 1988.

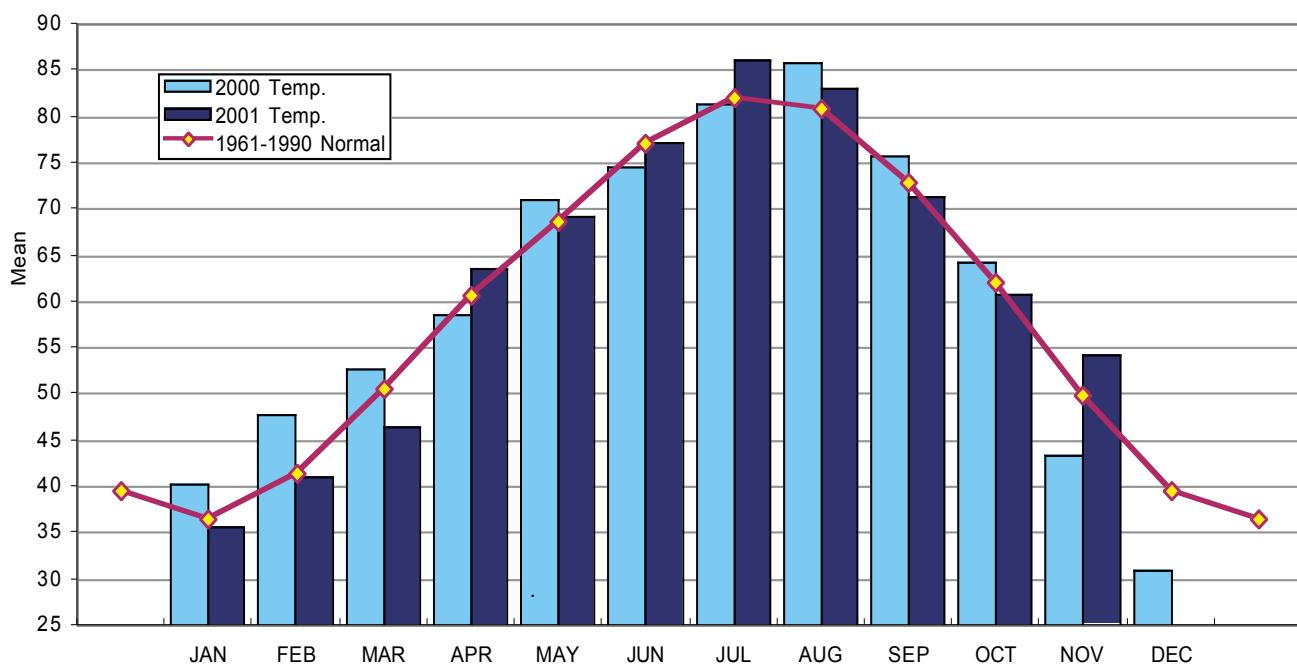

Locally heavy thunderstorms in north central and northeastern portions of the state on the 3<sup>rd</sup> produced several reports of substantial rain. The Haskell Mesonet site (Muskegee County) reported 3.81 inches of precipitation on the 3<sup>rd</sup>. Other reports from Mesonet sites on that date included: 3.64 inches at Skiatook (Osage), 3.53 inches at Pawnee (Pawnee), 3.37 inches at Wynona (Osage), and 2.81 inches at Porter (Wagoner). National Weather Service observers at Ingalls (Payne) and Billings (Noble) reported 3.50 and 3.10 inches, respectively. Harmon County received badly needed rainfall on the 15<sup>th</sup> when Vinson, Hollis, and the Hollis Mesonet site reported rainfall totaling 2.81, 2.52, and 2.77 inches, respectively.

**(Continued on page 3)**

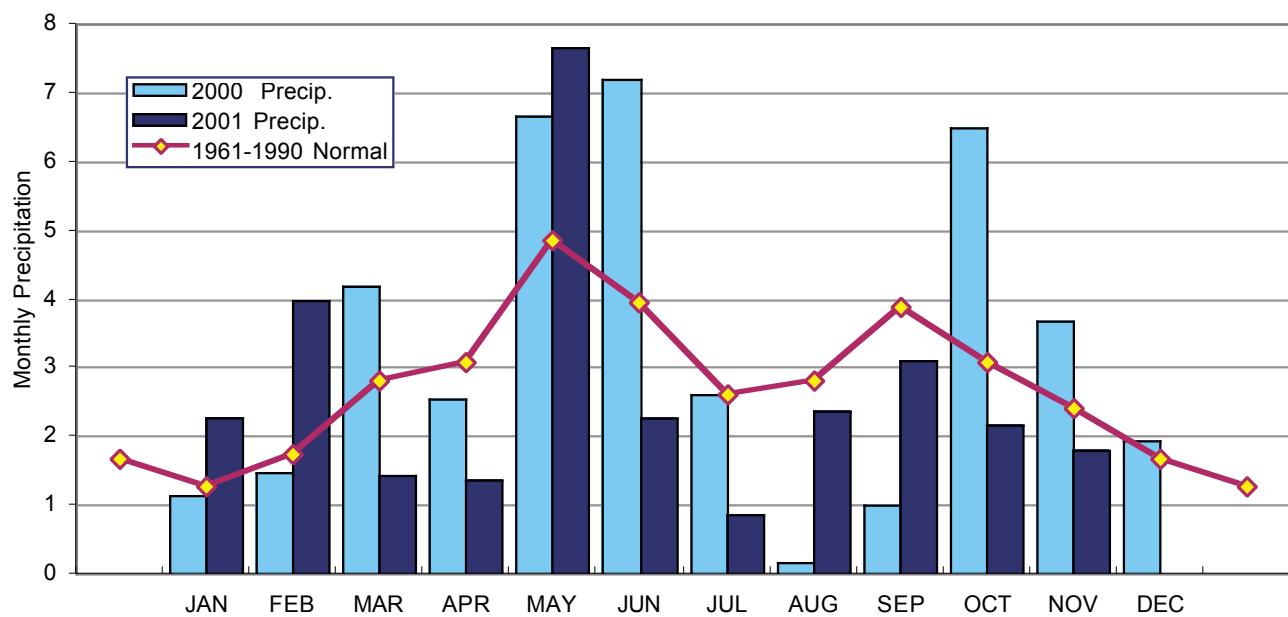

Oklahoma got its first real look at winter the week after Thanksgiving when a snowstorm struck southwestern and south central portions of the state, eventually extending through the central and northeastern portions as well. A band of heavy snow, including accumulations exceeding 6 inches, extended from around Frederick (Tillman) to Stroud (Lincoln). Frederick reported 12.50 inches of snow while Sedan (Kiowa) reported 9.5 inches, Chickasha (Grady) reported 8 inches, Lawton measured (Comanche) 7.5 inches, and Colony (Washita) reported 7.3 inches. Farther to the northeast, Norman (Cleveland) noted 6.9 inches and Stroud measured 7 inches of snow. Slick roads from the snow and some areas of freezing rain east of the snow band led to 5 traffic fatalities.

Howard L. Johnson  
Associate State Climatologist

Note: The above climate division summary contains similar information to the preceding tables but are the averages or extremes over all of the stations reporting in each climate division.

## CLIMATE DIVISION MAP

## EXPLANATION OF TABLES

The tables appearing on the preceding pages contain the following information for each station or climate division:

**Station Name:** The name of the observing site.

**Station Identification Number:** These numbers usually are assigned by the National Climatic Data Center.

**Climate Division:** See the figure above.

**Number of Temperature Observations:** These numbers are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

**Deviation from Normal:** The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

**Maximum Daily Temperature:** The maximum daily maximum temperature observed during the current month and year and the day on which it occurred.

**Minimum Daily Temperature:** The minimum daily minimum temperature observed during the current month and year and the day on which it occurred.

**Heating Degree Days:** HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. HDD are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. See the equation to the right for the HDD calculation.

**Deviation from Normal Heating Degree Days:** The difference between the actual HDD and the normal HDD for the month. A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

**Cooling Degree Days:** CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. CDD are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. See the equation to the right for the CDD calculation.

**Deviation from Normal Cooling Degree Days:** The difference between the actual HDD and the normal HDD for the month. A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

**Total Precipitation:** Often incorrectly referred to as a mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

**Number of Precipitation Observations:** The number of days a rain or no rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

**Deviation from Normal Precipitation:** The difference between the actual rainfall and the normal rainfall for the month. A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from the monthly total.

**Maximum 24-Hour Report and Day:** The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

#### **Heating Degree Days Calculation**

NumDays

$$\sum_{i=1}^{NumDays} 65 - ((TMAX_i + TMIN_i) / 2)$$

Where NumDays = the number of days in the month of interest (e.g., NumDays = 31 for January)

#### **Cooling Degree Days Calculation**

NumDays

$$\sum_{i=1}^{NumDays} ((TMAX_i + TMIN_i) / 2) - 65$$

Where NumDays = the number of days in the month of interest (e.g., NumDays = 30 for June)

### NOVEMBER 2001 STATEWIDE EXTREMES

VARIABLE	STATION	DIVISION	OBSERVATION	DATE
Minimum temperature ( F )	Fort Supply	2	7	28
	Fort Supply	2	7	29
Maximum temperature ( F )	Hollis	7	90	1
Maximum 24-hour Precipitation	Ingalls	5	3.50	4

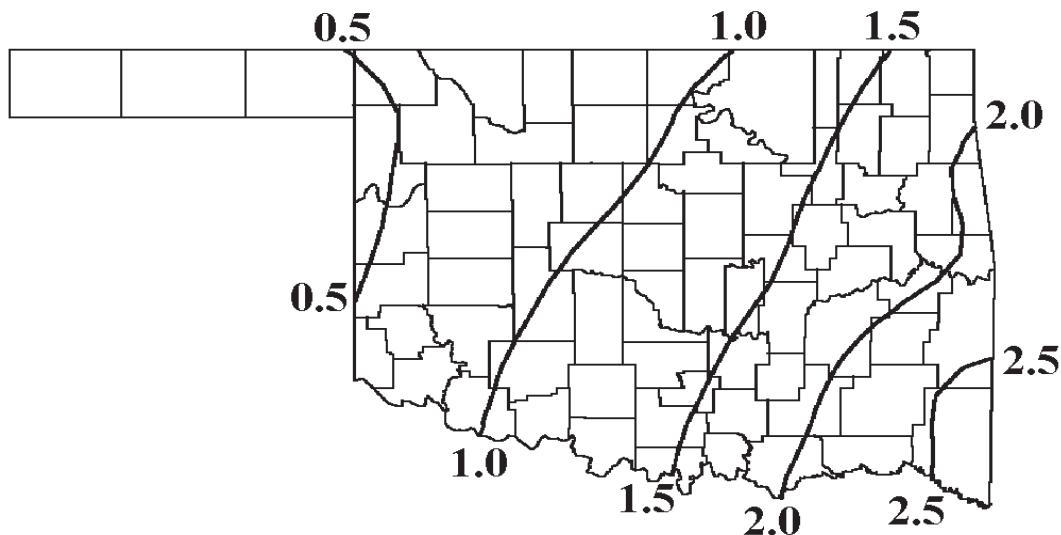

### JANUARY NORMAL DAILY MAXIMUM TEMPERATURE (°F)

### JANUARY NORMAL DAILY MINIMUM TEMPERATURE (°F)

## JANUARY NORMAL MONTHLY PRECIPITATION (INCHES)

## JANUARY TORNADO STATISTICS

The most tornadoes reported in **JANUARY** for Oklahoma was **(4)** in **1967**.

The average number of tornadoes in **JANUARY** for Oklahoma is **(0.2)**.

## OUTLOOK FOR JANUARY 2002 THROUGH MARCH 2002 BASED ON SEASONAL OUTLOOK PROVIDED BY THE CLIMATE PREDICTION CENTER

**Temperature:** Above Normal Temperature Statewide

**Precipitation:** Above Normal Precipitation Statewide

## OKLAHOMA CITY CLIMATE CALENDAR

### JANUARY

The data on this calendar are for Oklahoma City, Oklahoma.  
 Normal values are calculated for the period 1961-1990.  
 Temperature extremes are for the period 1905-1999.  
 Precipitation extremes are for the period 1888-1999.
